

Introduction to BlueMorph for WEA

September 7th, 2016

BlueMorphUV Science Team

Alex Farren

Chief Executive Officer

Alex is a professional **scientist** with a diverse experience in **biochemistry** and **environment toxicology** who has developed numerous novel applications within the field of food science. Prior to founding BlueMorph LLC, Alex worked as a chemist and research associate for both McGill and the Royal Victoria Hospital.

Alex has a **Master in Science in Toxicology** and a **Bachelors in Science in Biochemistry** from McGill University.

Noah Bareket

VP of engineering

Noah is an **optical scientist** and **former director of research and development** at Abbott Labs with over 30 years of R&D experience. Over his prolific career he has developed instruments and systems for the aerospace, semiconductor and bio-medical industries. He holds 21 issued patents and 14 pending for a variety of optical systems and instrumentation.

Noah has a **PhD in Optical Science** from the University of Arizona and a **Master in Science** from the Weizmann Institute of Technology.

My first “Entry Level” Job in the Wine Industry

There has to
be a better way!

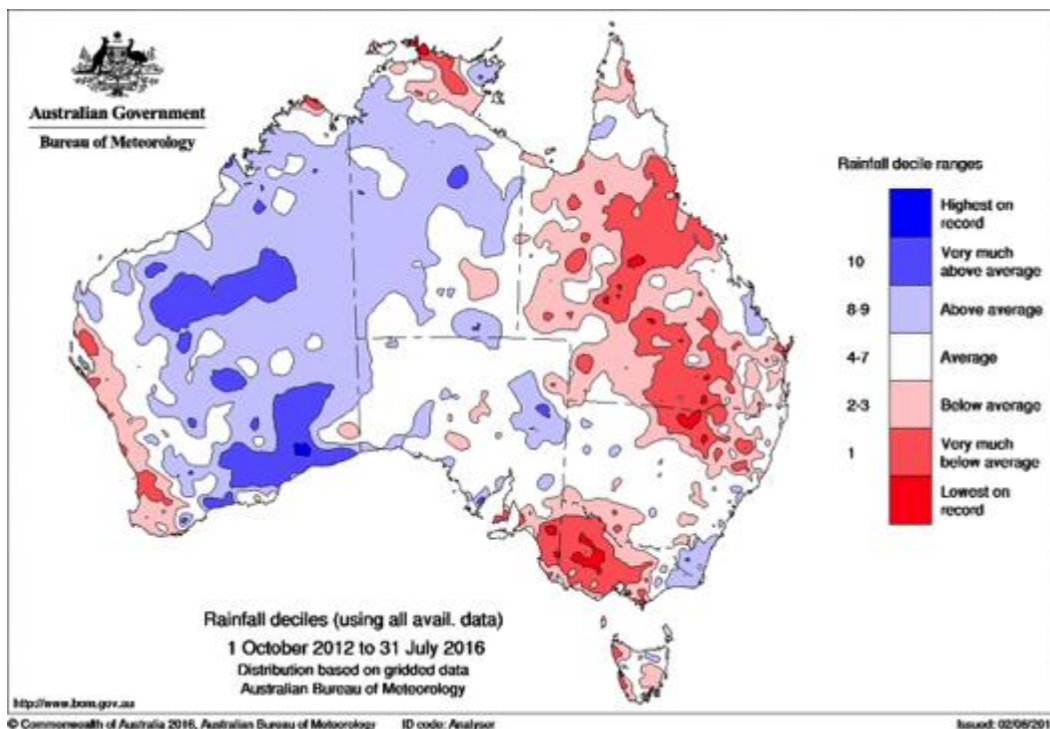

The Problems

“Wastewater mainly comes from washing tanks...,”
(source: , Sheldon Sapoznik, Napa land use supervisor)

Up to a 6:1 ratio of wastewater to wine (source SF gate)

Best in Class appears to require a nearly 3:1 wastewater to wine ratio.

Droughts. Severe and widespread droughts in the next 30–90 years over many land areas resulting from either decreased precipitation and/or increased evaporation.
(source Nature)

The Problems - Water

The Problems - Chemicals

CAUTION

It is illegal & against company policy to dispose of or pour any material or chemical down drain.

The Problems - Electricity

The Problems - Labour

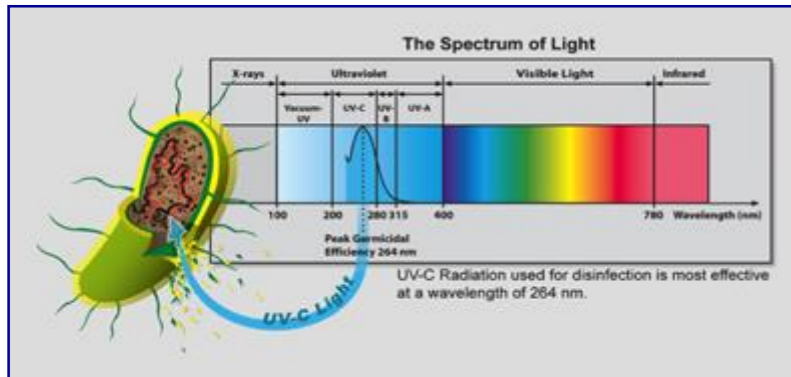

The Problems – Effectiveness/Reproducibility

Sanitize \neq Sterilize

The Solution - UVC

UVC kills by inactivating DNA

DNA optimally absorbs UV light at around 260nm. The lamps used in our units emit UVC light at around 254nm.

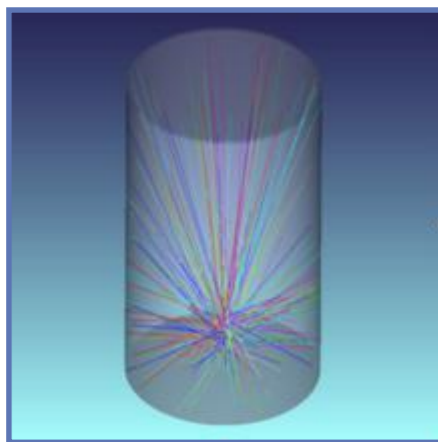

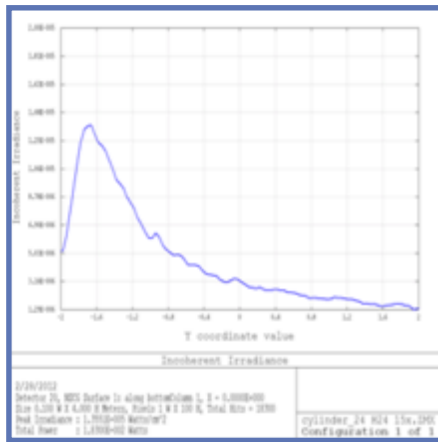

DNA forms two photoproducts, one being a cyclobutane ring between adjacent pyrimidines.

Germicidal UVC (FDA approved!) Proven sanitization technology in water medical, medical services and laboratories

First use of UVC on drinking water was in Marseilles, France in 1910. Now used worldwide, over 6000 water treatment plants in Europe, used in HVAC systems and hospitals.

BlueMorphUV's Innovation

A patented method using advanced software & proprietary algorithms to determine UVC dose requirements for any shaped container or vessel.

Mission Statement

« BlueMorph LLC seeks to use **technology** to **reduce the environmental footprint** of industrial/manufacturing processes while having a **positive long term impact on the bottom line** of the businesses that use them. »

Alex Farren
Inventor & Chief Executive Officer

The Benefits

UV Tank Systems

Commercial germicidal UVC systems compatible with 99% of tanks in the market.

The Results

50-70%

100%

50-60%

Up to 70%

99.999%

Significant

The Benefits – Set-Up and Break-Down

The Benefits – Set-Up and Break-Down

Safety concerns and Maintenance

UVC is **not** an ionizing form of radiation therefore there are **NO** regulations found in U.S. OSHA or Australia WHS.

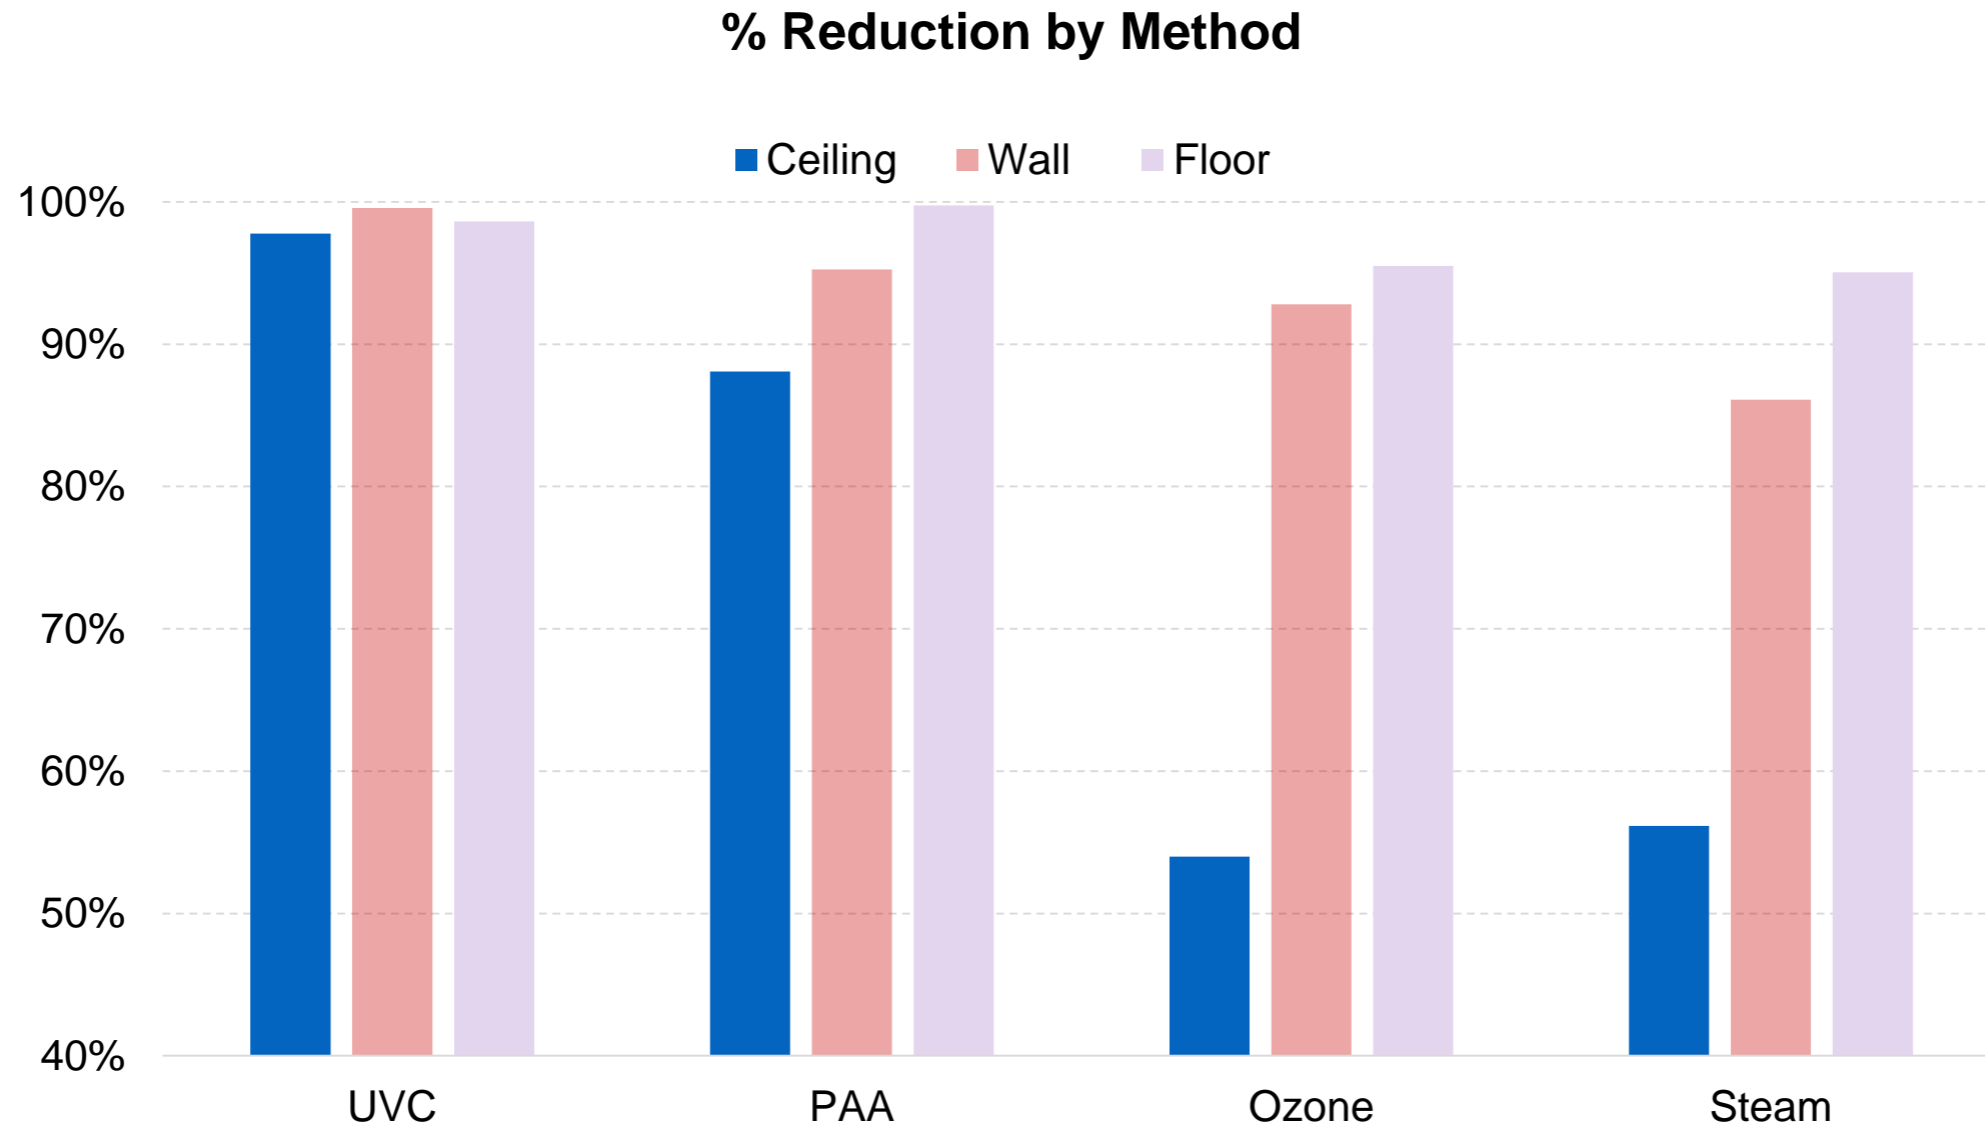

Lamps **are sleeved in a Teflon**, therefore in case of breakage, all contents of the lamps are contained and **guaranteed not to spill in tank**.

Lamps can be replaced by cellar hands in about 15 minutes.

Results: More Effective and Reproducible

Third party tested on Ceiling, Wall and Floor

Validation

Bioluminescence based studies can yield false positives.

There has been NO correlation between ATP levels and Colony Forming Units (CFU's).

Determines solely the absence of organic material containing ATP.

Plating/CFU studies are the only truly reliable way to track viability of contaminating microorganisms within tanks/containers.

Performance Guarantee

BlueMorphUV guarantees that our units will effectively sanitize stainless steel tanks (not valves and fittings). The tanks must be visibly clean and free of debris and film prior to UVC exposure. If your facility is not satisfied with the performance we can adjust irradiation levels to meet or exceed your current sanitization levels achieved by the existing protocol. If you are still not satisfied with the results or for any other reason within 90 days of installation, we will take the unit back and give a full refund*

**The unit must be undamaged and the amount of the refund is limited to the actual price paid for the unit in question and shall not include any other costs associated with installation or operation of the subject unit.*

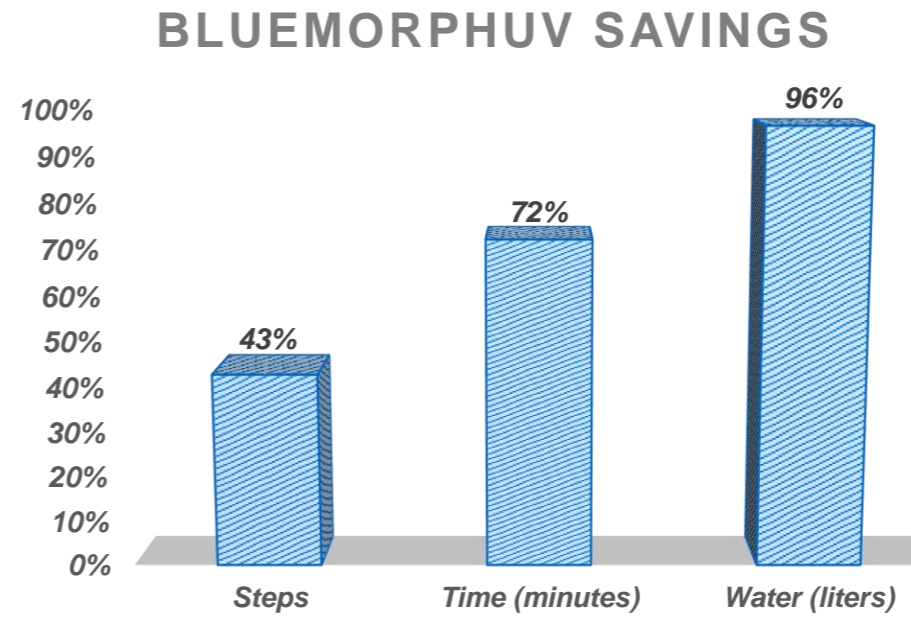

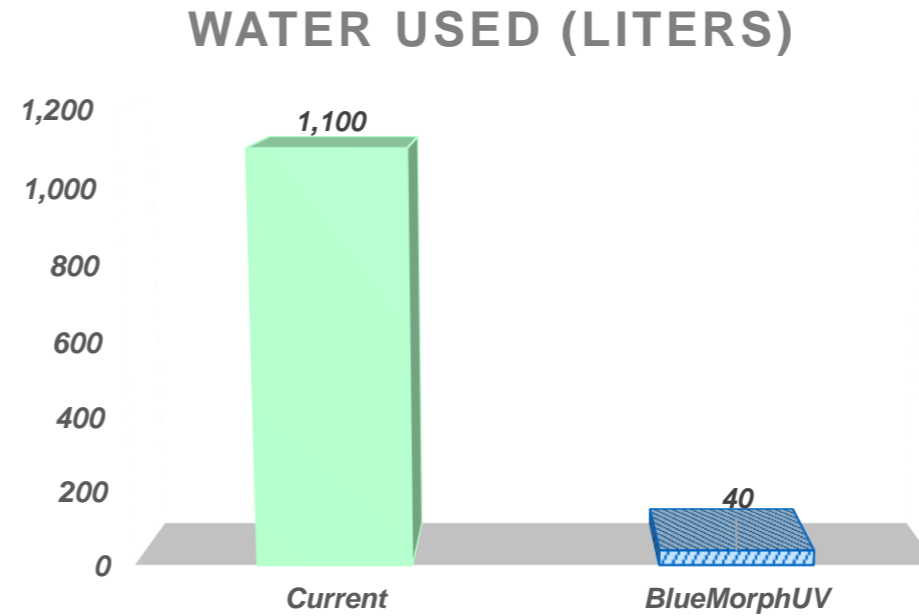

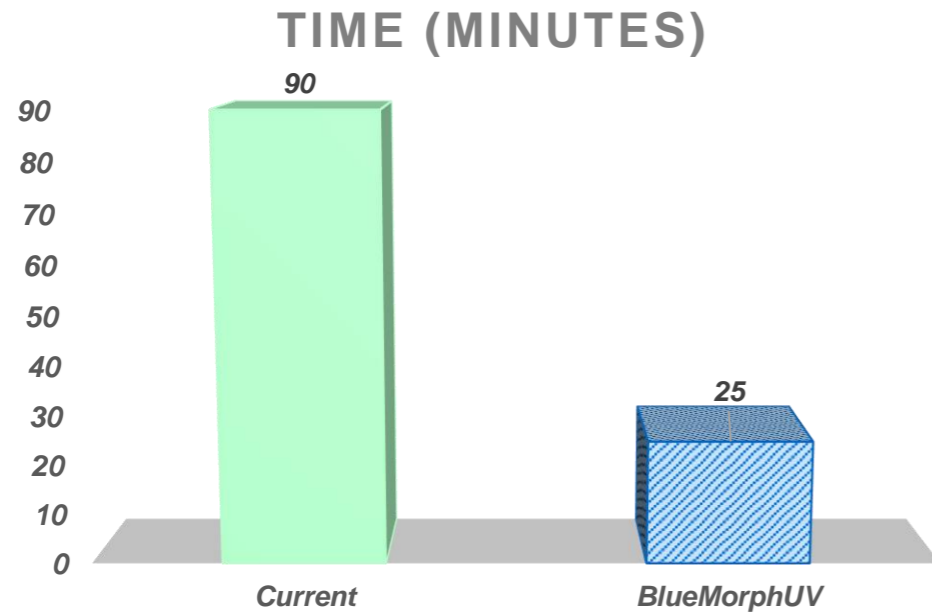

Payback Study: Hall Wines (100,000 cases yearly)

Current SOP			Steps	BlueMorphUV	
Time	Water	Time		Water	
5 min	40 L	1	5 min rinse	40 L

Process Comparison – Significant Savings

Product Line-Up 2016

UVT200K

Largest Unit, capable of sanitizing tanks in excess of 1,000,000 liters. Target customer is any winery with tanks greater than 40,000 liters.

UVT6K

Mid-sized unit, capable of sanitizing tanks up to 40,000 liters. Target is smaller American wineries and International market with smaller tanks.

UVT2K

Smallest unit, capable of sanitizing tanks 12,000 liters and under. Goal is to address smallest wineries and to make technology available to wineries of all sizes.

UV55

In development. We are working on using UVC to retrofit their barrel washing systems for added security and “knock back” as well as a hand held unit for small wineries.

Recognition, Awards & Grants

Thank You!

Trial Results (by BevTrac)

Improved sanitization effectiveness as measured by:

Higher reductions in Colony Forming Units (CFUs)

Resulting in overall lower CFUs
